

Claim (What I think is true):

Light does affect the color of the algae.

Evidence (Information that supports my claim):

Using the color chart, I observed that the numbers for the algae in the dark went down over time- from 2-1. Using the color chart, I also observed that the numbers for the algae in the light went up over time – from 2-3.

Reasoning (This is **how** my evidence supports my claim):

The algae in the dark lost its color over time because there was no light. My control got greener over time because it did have light. Light does affect the color of the algae.
